

DIATOMACEOUS EARTH

Application Instructions

Vacuum the area before treatment commences. Entopest Diatomaceous Earth natural dusting powder should be sprinkled lightly to the treatment area and then rubbed in with a brush or broom. It is important to finely cover the surface rather than leave bulk and detectable powder.

Powder can also be mixed with water at the rate of 4 tablespoons of dust to 1 gallon (4.5ltr) of water and sprayed on the treatment area.

As the powder doesn't dissolve, the mixture should be shaken or agitated frequently to ensure the mixture is consistent. The addition of 1 tablespoon of mild detergent to the mixture will help to keep the powder in suspension and distribute it further into cracks and crevices.

Do not vacuum the treated areas for as long as possible after an application. Repeat process weekly until all activity ceases. Use only in dry areas.

Please note that Entopest Diatomaceous Earth should not be used as the sole treatment method but as a combination with other suitable products for pest management such as Entopest Non-Toxic Control Spray and/or Entopest Pheromone/Attractant Traps.

DO NOT BREATHE POWDER
KEEP OUT OF REACH OF CHILDREN
DUST PARTICLES IN THE EYES CAN BE
WASHED OUT WITH CLEAN WATER
